DESCRIPTION

E2K Menu, the ideal web application for every type of restaurant

E2K Menu was created with the aim of offering customers, belonging to the catering sector, **a multifunctional platform that allows them to simplify and speed up certain activities** in their business. In fact, this software solution allows the **creation, management and display of the digital menu**, which can be customised with any type of information. Moreover, the end user can book or order, directly from his smartphone, for **take-away services, home delivery and table orders** without any interaction with the operator.

Full digital menu customisation

One of the strengths of E2K Menu is the possibility of **total customisation of the platform**, tailored to the customer's needs. In fact, the operator can add various types of menus according to time slots or according to different price lists for several locations. The application also takes into account variants, allergens and all information useful to the customer.

Integration with E2K Suite

It is possible to **integrate E2K Menu with the E2K Suite system** to exploit the full potential of this application. This allows a complete and tailor-made management for each type of locality, from online table reservation to the operational phase of the order, from communication between the various departments to the payment of the bill.
